

Lake Terramuggus Weed Eradication Project

Treatment of the emergent plants is scheduled for September 19th with a back- up rain date of the 20th. This weed management program is focused on the shoreline area to selectively control nuisance Cattail (typha) and Common Reed (phragmites australis) growth.

The product application will be AquaPro Herbicide that utilizes Glyphosate a USEPA/CT registered aquatic herbicide that when used in accordance with the product label by licensed pesticide applicators poses little risk to the environment and human health. According to the EPA product label, there are no water use restrictions with the use of Glyphosate. However, we will ask that people stay out of the treated areas for 12 hours as an extra precaution.
